

Software application for landscaping garden and housing areas

Within the framework of the CTCC project (Creative Traditional Companies Cooperation), the designer Nils Remer from Wismar, Mecklenburg-Western Pomerania, developed in collaboration with regional gardening and construction companies a unique easy-to-use software tool for the individually attractive design creation of real estates, garden properties and house building areas.

The developed software combines the individual design wishes with the variety of garden and landscaping products. The application software convinces with a user-friendly and well-arranged modular concept. In contrast to other, more complex and confusing applications, the shop library focuses on an individual photo of the location and the available products solutions. This combination enables users to visualize their concrete design ideas easily and quickly.

Benefits of the software:

- the individual program interface and product library,
- direct start of the software without installation,
- individual user photos as a design basis,
- user-friendly program structure and quickly visualized results,
- automatic determination of the required sizes and quantities.
